

Some guidelines that can help identify which products are required to create solution, if however you are still unsure or have any questions, please contact us for assistance.

### STEP 1

In order to scan bar codes your items first have to have bar code labels on them. You may need to print bar coded item labels or you may need to track the bar codes that are on the item when you receive them. Most of our solutions start with our PBT for Windows bar coding labeling and bar code database add-on module for Sage Accpac ERP.

### STEP 2

The next step is to identify what operational requirements your company has and to select the best solution. Some customers may need to implement the system to satisfy customer requirements and others may simply want to become more efficient in their warehouse operations.
